The basic processes occurring in the dispersed air-  
viscose system during deaeration are considered. It is  
shown that the phase transitions gas-liquid, formerly  
not taken into account, play an important role. The  
mathematical relationship between the time of complete  
deaeration of viscose and processing conditions is de-  
rived. It is shown that the experimental data on the  
determination of the time of deaeration of viscose agree  
with the theoretical curve. (Author)
